

IN THE ABSTRACT:

Please substitute the following Abstract for the Abstract starting at page 38, line 2 and ending at line 13.

A display device is driven by a driving method including a first drawing step of displaying an image by controlling a display medium on the basis of a first image signal ~~from first image creation means~~, and a second drawing step of overwriting a handwritten image on the displayed image by controlling the display medium on the basis of a second image signal ~~from second image creation means~~. In the first drawing step, an image is ~~rewritten~~ drawn by a reset drive for resetting a previous display state image and a writing drive for writing an image, and in the second drawing step, the writing drive of a minimum or a substantially maximum luminance is performed without effecting the reset drive only in an area in which the handwritten image is written.
